Mycobacterium vaccae in the treatment of uveitis

This invention relates to the treatment of uveitis.

British Specification No. 2156673 describes immunotherapeutic agents comprising killed cells of

5 Mycobacterium vaccae. These agents are useful in the immunotherapy of mycobacterial disease, especially tuberculosis and leprosy. It is stated that use of this immunotherapeutic agent facilitates the removal of the persisting bacilli responsible for tuberculosis or leprosy

10 which, as is well known, it is difficult to remove by chemotherapy alone. It is suggested in the specification that the immunotherapeutic agent is believed to act by presenting the "protective" common mycobacterial antigens to advantage and by containing immune suppressor

15 determinants which are active in regulating disadvantageous immune mechanisms. As a consequence, "persister" bacilli are recognized by the immune system by their content of common mycobacterial antigens and effective immune mechanisms are directed against them, in the absence of the

20 tissue necrotic form of immunity usually present in mycobacterial disease.

International Patent Specification PCT/GB 85/00183 describes compositions for the alleviation of the symptoms of, and for the treatment or diagnosis of, arthritic

25 diseases which comprise as active ingredient the whole organism of M. vaccae. It is stated that the preparations

- 2 -

of M. vaccae are useful for the treatment of various autoimmune diseases and especially arthritic conditions including rheumatoid arthritis, ankylosing spondylitis or Reiter's syndrome.

5           Uveitis is a condition, often observed in leprosy patients but also found in other individuals, which is difficult to treat and leads to permanent blindness. The present invention is founded upon the surprising observation that compositions comprising antigenic and  
10 immunoregulatory material derived from Mycobacterium vaccae are useful in the treatment of uveitis.

The present invention accordingly provides a method for the treatment of uveitis which comprises administering to the patient suffering from such a condition an effective  
15 amount of a therapeutic composition comprising antigenic and immunoregulatory material derived from Mycobacterium vaccae.

The invention further provides antigenic and immunoregulatory material derived from M. vaccae for use in  
20 the manufacture of a therapeutic agent for the treatment of uveitis. Such antigenic and immunoregulatory material is also provided for use in the manufacture of a therapeutic agent for use in the treatment of uveitis.

The therapeutic agent of the invention  
25 conveniently, and therefore preferably, comprises dead cells of M. vaccae, most preferably cells which have been

- 3 -

killed by autoclaving or by irradiation. The therapeutic agent normally comprises more than  $10^8$  microorganisms per ml of diluent, and preferably from  $10^8$  to  $10^{11}$  killed M. vaccae microorganisms per ml of diluent.

- 5           The diluent may be pyrogen-free saline for injection alone, or a borate buffer of pH 8.0. The diluent should be sterile. A suitable borate buffer is:

|    |  |            |
|----|--|------------|
|    | $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ | 3.63 g     |
|    | $\text{H}_3\text{BO}_3$                                      | 5.25 g     |
| 10 | $\text{NaCl}$  | 6.19 g     |
|    | Tween 80   | 0.0005%    |
|    | Distilled Water  | to 1 litre |

- The preferred strain of M. vaccae is one denoted R877R isolated from mud samples from the Lango district of  
15 Central Uganda (J.L. Stanford and R.C. Paul, Ann. Soc. Belge Med, Trop. 1973, 53 141-389). The strain is a stable rough variant and belongs to the aurum sub-species. It can be identified as belonging to M. vaccae by biochemical and antigenic criteria (R. Bonicke, S.E. Juhasz., Zentr albl.  
20 Bakteriол. Parasitenkd. Infection skr. Hyg. Abt. 1, Orig., 1964, 192, 133).

The strain denoted R877R has been deposited under the Budapest Convention at the National Collection of Type Cultures (NCTC) Central Public Health Laboratory, Colindale

- 4 -

Avenue, London NW9 5HT, United Kingdom on February 13th, 1984 under the number NCTC 11659.

For the preparation of the therapeutic agent, the microorganism M. vaccae may be grown on a suitable solid medium. A modified Sauton's liquid medium is preferred (S.V. Boyden and E. Sorkin., J. Immunol, 1955 75, 15) solidified with agar. Preferably the solid medium contains 1.3% agar. The medium inoculated with the microorganisms is incubated aerobically to enable growth of the microorganisms to take place, generally at 32°C for 10 days. The organisms are harvested, then weighed and suspended in a diluent. The diluent may be unbuffered saline but is preferably borate-buffered and contains a surfactant such as Tween 80 as described above. The suspension is diluted to give 100 mg of microorganism/ml. For further dilution, borate buffered saline is preferably used so that the suspension contains 10 mg wet weight of microorganisms/ml of diluent. The suspension may then be dispensed into 5 ml multidose vials. Although the microorganisms in the vials may be killed using irradiation e.g. from <sup>60</sup>Cobalt at a dose of 2.5 megarads, or by any other means, for example chemically, it is preferred to kill the microorganisms by autoclaving, for example at 10 psi (69 kPa) for 10 minutes (115°-125°C). It has been discovered, unexpectedly, that autoclaving yields a more effective preparation than irradiation.

- 5 -

The therapeutic agent is in general administered by injection in a volume in the range 0.1-0.2 ml, preferably 0.1 ml, given intradermally. A single dosage will generally contain from  $10^7$  to  $10^{10}$  killed M. vaccae 5 microorganisms. It is preferred to administer to patients a single dose containing  $10^8$  to  $10^9$  killed M. vaccae. However, the dose may be repeated depending on the condition of the patient.

While the present invention does not depend on the 10 truth of this theory it is believed that the active ingredient in the killed M. vaccae may be the 65 kDa mycobacterial heat shock protein (hsp 65) described by Young et al. "Stress proteins are immune targets in leprosy and tuberculosis", Proc. Natl. Acad. Sci. U.S.A. 85 15 (1988), pp4267-4270 in a form obtained from M. bovis. The preferred autoclaved M. vaccae cells used in the present invention are believed to provide an effective package of the hsp 65 and other substances in a convenient adjuvant.

Although the therapeutic agent will generally be 20 administered by intradermal injection, other routes, e.g. oral administration, can also be used.

It may be advantageous and is within the scope of the invention to use more than one strain of M. vaccae, and/or to include in the immunoprophylactic agent other 25 mycobacterial antigens. Tuberculin may also be included.

The immunoprophylactic agent may also contain BCG

- 6 -

(Bacillus Calmette-Guerin) vaccine, in particular the freeze-dried form of the vaccine, to promote its effect.

The therapeutic agent can contain further ingredients such as adjuvants, preservatives, stabilisers etc. It may be supplied in sterile injectable liquid form or in sterile freeze-dried form which is reconstituted prior to use.

M. vaccae may be used as such or as an extract or fractioned portion of the organism to manufacture the therapeutic agents according to the invention.

The following Example illustrates the invention.

#### EXAMPLE

M. vaccae NCTC 11659 is grown on a solid medium comprising modified Sauton's medium solidified with 1.3% agar. The medium is inoculated with the microorganism and incubated for 10 days at 32°C to enable growth of the microorganism to take place. The microorganisms are then harvested by gently scraping the surface of the agar and weighed (without drying) and suspended in M/15 borate buffered saline at pH8 to give 10 mg of microorganisms/ml of saline. The suspension is dispensed into 5 ml vials, and then autoclaved for 10 minutes at 10 psi (69 kPa) to kill the microorganisms. After cooling, the therapeutic agent thus produced is stored at 4°C before use. A single dose consists of 0.1 ml of the suspension, which should be shaken vigorously immediately before use, containing 1 mg

- 7 -

wet weight of M. vaccae. Th dose is given by intradermal injection normally over the left deltoid muscle.

Of 148 fully treated leprosy patients, 79 were given M. vaccae therapy and 69 received a placebo. In the  
5 group receiving M. vaccae therapy, 17 showed symptoms of uveitis and of these, 13 were cleared of uveitis one year after therapy. In contrast, of the 69 patients receiving placebo, 12 showed symptoms of uveitis at the start of treatment and the uveitis cleared in only 4. This result  
10 is significant at  $p < 0.005$ .

- 8 -

CLAIMS

1. Us of antigenic and/or immunoregulatory material derived from Mycobacterium vaccae in the manufacture of a therapeutic agent for the treatment of uveitis.
2. The use according to claim 1, wherein the antigenic and/or immunoregulatory material derived from M. vaccae comprises dead cells of M. vaccae.
3. The use according to claim 2, wherein the cells of M. vaccae have been killed by autoclaving.
4. The use according to claim 1, wherein the antigenic and/or immunoregulatory material derived for M. vaccae comprises the 65 kDa heat shock protein.
5. The use according to any one of the preceding claims, wherein the material derived from M. vaccae is derived from the strain as deposited at the National Collection of Type Cultures (NCTC) Central Public Health Laboratory, Colindale Avenue, London NW9 5HT, United Kingdom on February 13th, 1984 under the number NCTC 11659.
6. The use according to any one of the preceding claims, wherein the therapeutic agent contains, per dose, antigenic and/or immunoregulatory material from  $10^7$  to  $10^{10}$  M. vaccae microorganisms.
7. A method for the treatment of uveitis which comprises administering to the patient suffering from such a condition an effective amount of antigenic and/or

- 9 -

immunoregulatory material derived from Mycobacterium vaccae.

8. A method according to claim 7, wherein the material derived from M. vaccae is as defined in any one of  
5 claims 2 to 6.

9. Products comprising antigenic and/or immunoregulatory material derived from Mycobacterium vaccae for use in treatment of uveitis.

10. Products according to claim 9, wherein the material derived from M. vaccae is as defined in any one of  
claims 2 to 6. /

11. A pharmaceutical agent for use in the treatment of uveitis which agent comprises antigenic and/or immunoregulatory material derived from Mycobacterium vaccae.  
15 vaccae.

12. An agent according to claim 11, wherein the material derived from M. vaccae is as defined in any one of claims 2 to 6.

## FURTHER INFORMATION CONTINUED FROM THE SECOND SHEET

V. ☒ OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE

This international search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:

1. ☐ Claim numbers \_\_\_\_\_, because they relate to subject matter not required to be searched by this Authority, namely:

Although claims 7 - 8 are directed to a method of treatment of the human body the search has been carried out and based on the alleged effects of the composition.

2. ☐ Claim numbers \_\_\_\_\_, because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claim numbers \_\_\_\_\_, because they are dependent claims and are not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING

This international Searching Authority found multiple inventions in this international application as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application.
2. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application for which fees were paid, specifically claims:
3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:
4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the international Searching Authority did not invite payment of any additional fee.

## Remarks on Protest

- ☐ The additional search fees were accompanied by applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

**ANNEX TO THE INTERNATIONAL SEARCH REPORT  
ON INTERNATIONAL PATENT APPLICATION NO.**

GB 9101970
